

CEO & CMO Presentation Script

CEO & CMO Presentation Script – Online Retail Sales Dashboard

Introduction

Good morning everyone.

Today I'll be presenting the findings from the Online Retail Sales Dashboard that I developed using Microsoft Power BI. The objective of this analysis was to answer four key business questions related to revenue trends, customer behavior, geographic performance, and product demand.

Before creating the visuals, I first performed data loading, cleaning, and transformation to ensure the analysis was accurate and reliable.

I imported the Online Retail dataset into Power BI using Power Query and verified the data types for all important fields such as Invoice Date, Quantity, Unit Price, Customer ID, and Country.

I also created a Revenue measure using DAX where Revenue was calculated as Quantity multiplied by Unit Price using the SUMX function.

Question 1 – Monthly Revenue Trend for 2011

The first visual is a line chart showing monthly revenue trends during the year 2011.

Revenue remained relatively stable during the first half of the year but increased significantly from September onward.

The highest revenue was recorded in November 2011, likely due to holiday shopping and pre-Christmas purchasing behavior.

For the CEO, this insight supports operational planning during peak sales periods.

For the CMO, this indicates that marketing campaigns should be intensified during the final quarter of the year.

Question 2 – Top 10 Countries by Revenue and Quantity

The second visual compares revenue and quantity sold across the top 10 countries excluding the United Kingdom.

Countries such as the Netherlands, EIRE, Germany, and France generated the highest revenue outside the UK.

This identifies strong international markets for potential business expansion and targeted marketing campaigns.

Question 3 – Top 10 Customers by Revenue

The third visual displays the top 10 customers based on revenue contribution.

Customer ID 14646 emerged as the highest revenue-generating customer.

This highlights the importance of customer retention and loyalty programs for high-value customers.

Question 4 – Units Sold by Country

The final visual is a map chart showing total units sold by country excluding the UK.

The analysis revealed strong sales activity across Europe, North America, and Australia.

This insight can support supply chain optimization and regional marketing strategies.

Conclusion

To conclude, the dashboard successfully answered all four business questions.

The analysis revealed strong seasonal sales trends, high-performing international markets, valuable customer segments, and important geographic demand patterns.

These insights can support better decision-making related to operations, marketing, customer retention, and future business growth.

Thank you.
